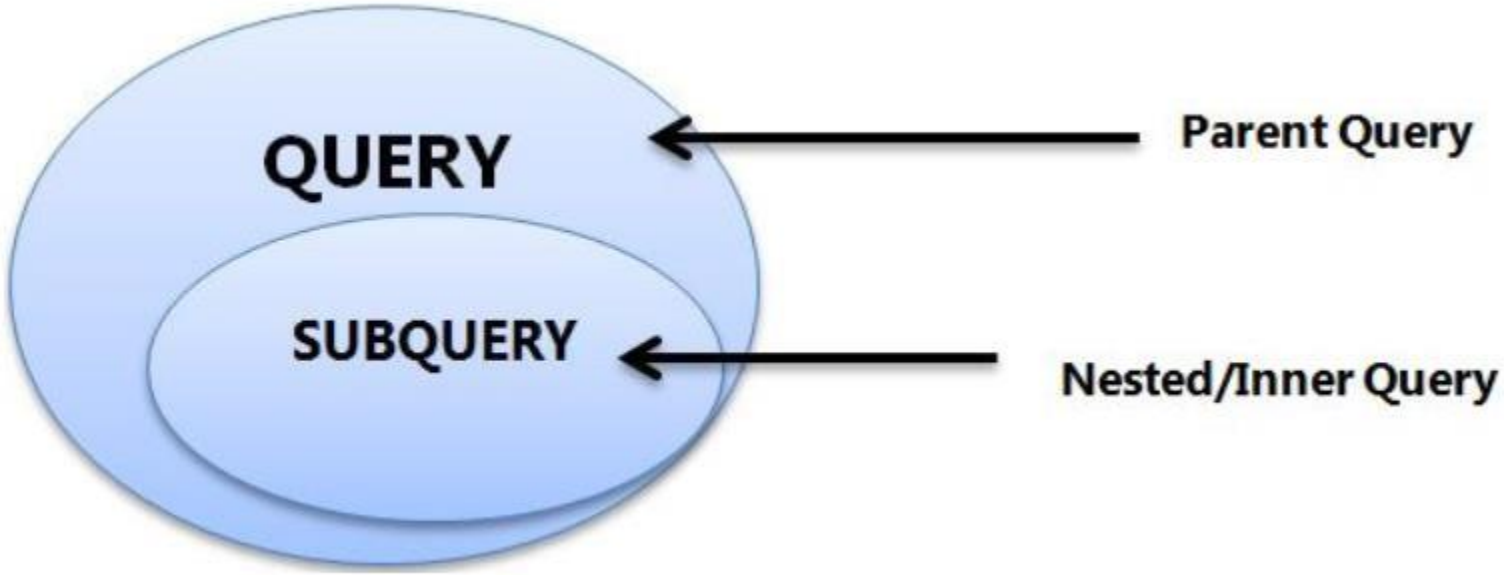
DATABASE SYSTEMS

SUB QUERIES

By Sana Faiz
Sana.faiz.muet83@gmail.com

SUBQUERY

- A subquery is a SQL query nested inside a larger query.
- A subquery may occur in:
  - **A SELECT clause**
  - **A FROM clause**
  - **A WHERE clause**
- The subquery can also be nested inside INSERT, UPDATE, or DELETE statement or inside another subquery.
- A subquery is usually added within the WHERE clause of another SELECT statement. But it can also be used in FROM and HAVING clause.
- Comparison operators, such as **>, <, or =** can be used.
- The comparison operator can also be a multiple-row operator, such as **IN, ANY, or ALL.**
- A **subquery** is also called an **inner query** or inner select, while the statement containing a subquery is also called an outer query or outer select.
- The inner query executes first before its parent query so that the results of an inner query can be passed to the outer query.



SYNTAX (WHERE CLAUSE SUBQUERY):

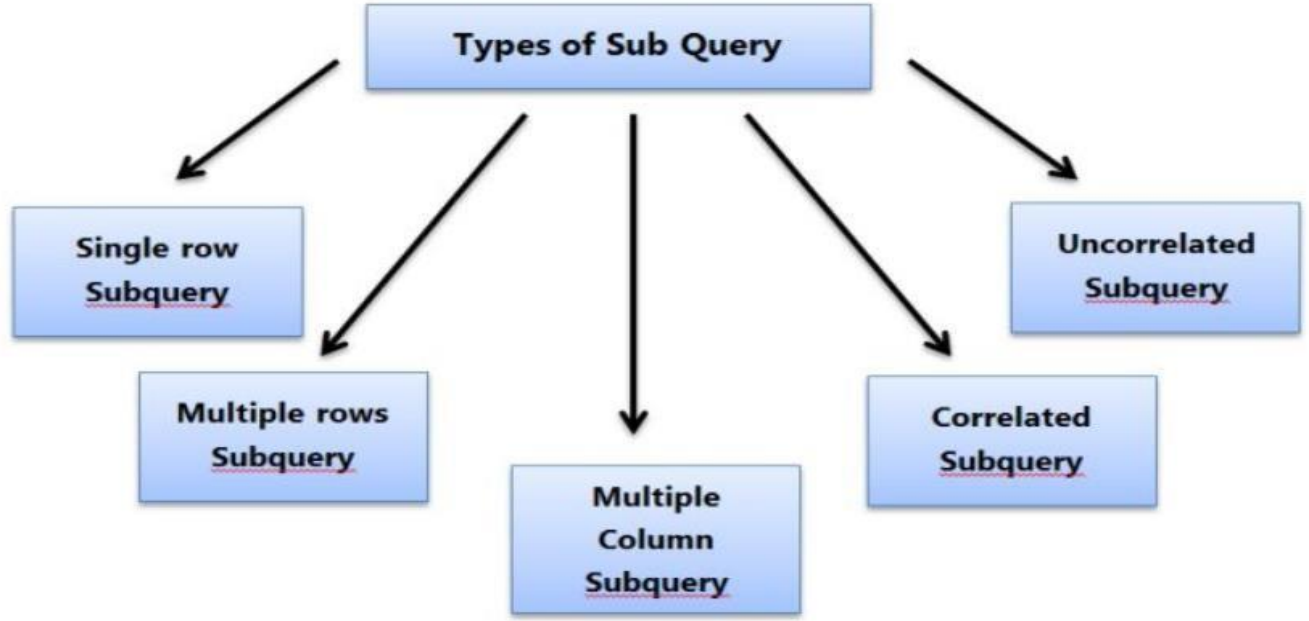
```
SELECT    select_list
FROM      table
WHERE     expr operator
                    (SELECT    select_list
                    FROM       table);
```

GUIDELINES FOR SUBQUERIES

- A subquery must be enclosed in parentheses.
- A subquery must be a complete query in itself i.e., it must have a SELECT and a FROM clause.
- A subquery must be placed on the right side of the comparison operator.
- Subqueries cannot manipulate their results internally, therefore ORDER BY clause cannot be added into a subquery. Though ORDER BY clause can be used in the main SELECT statement (outer query) where it will be the last clause.
- Use single-row operators with single-row subqueries.
- If a subquery (inner query) returns a null value to the outer query, the outer query will not return any rows when using certain comparison operators in a WHERE clause.

TYPES OF SUBQUERIES

1. Single row subquery : Returns zero or one row.
2. Multiple rows subquery : Returns multiple rows.
3. Multiple columns subqueries : Returns more columns.



SINGLE ROW SUBQUERY

- A **single row subquery** returns zero or one row to the outer query.
- Single row subquery returns a single column to the outer query.
- It can be placed in a WHERE clause, a HAVING clause, or a FROM clause of a SELECT statement.
- Comparison operators such as =,<>, >, <, <, can be used with a single row subquery.

WHY DO WE NEED SUBQUERIES?

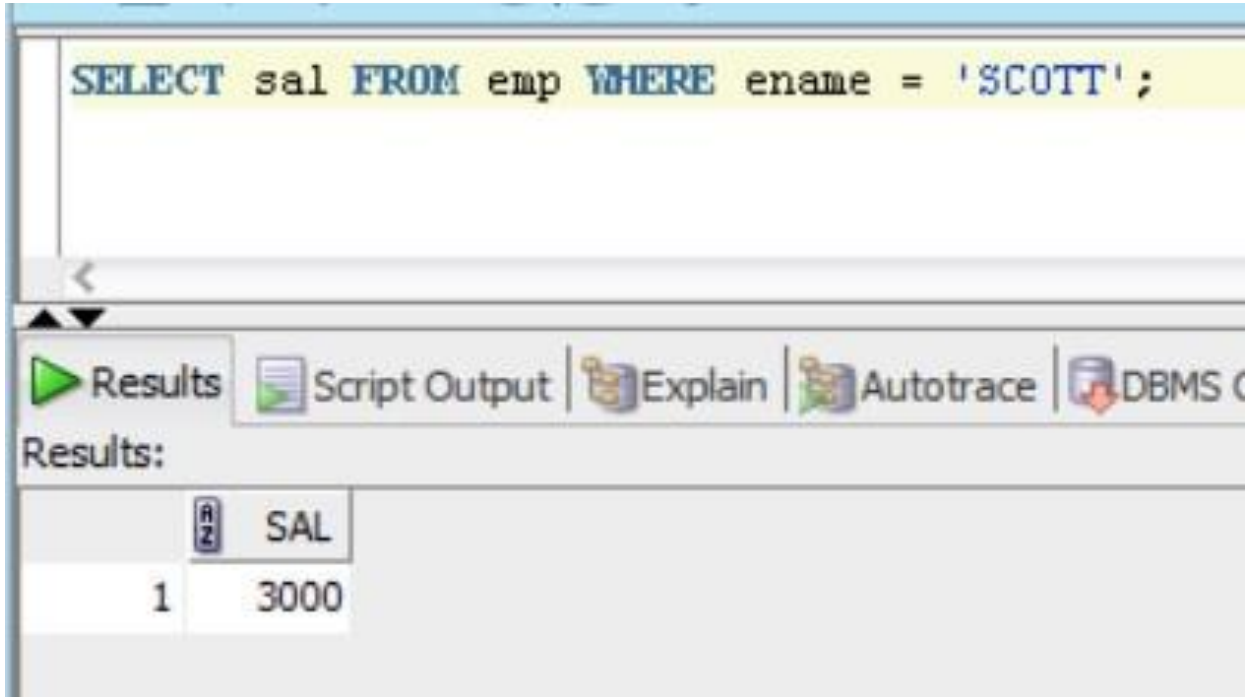
- Subqueries are normally used when one needs to retrieve rows from a table based on a condition that depends upon the data in the table itself.

Display all the employees who are earning more than ‘SCOTT’

Two query solution:

1. Find how much SCOTT earns? **(Query 1)**
2. Use SCOTT’S salary to find the required employees. **(Query 2)**

1.Find how much SCOTT earns? (Query 1)



2. Use SCOTT'S salary to find the required employees. (Query 2)

```
SELECT * FROM emp WHERE sal > 3000;
```

Results | Script Output | Explain | Autotrace | DBMS Output | OWA Output

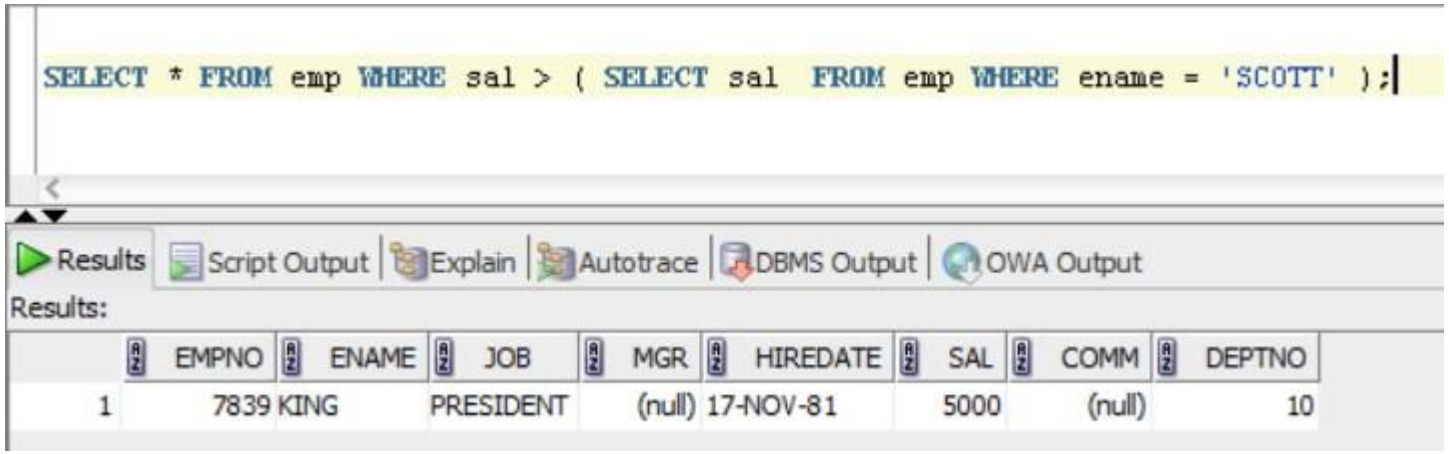
Results:

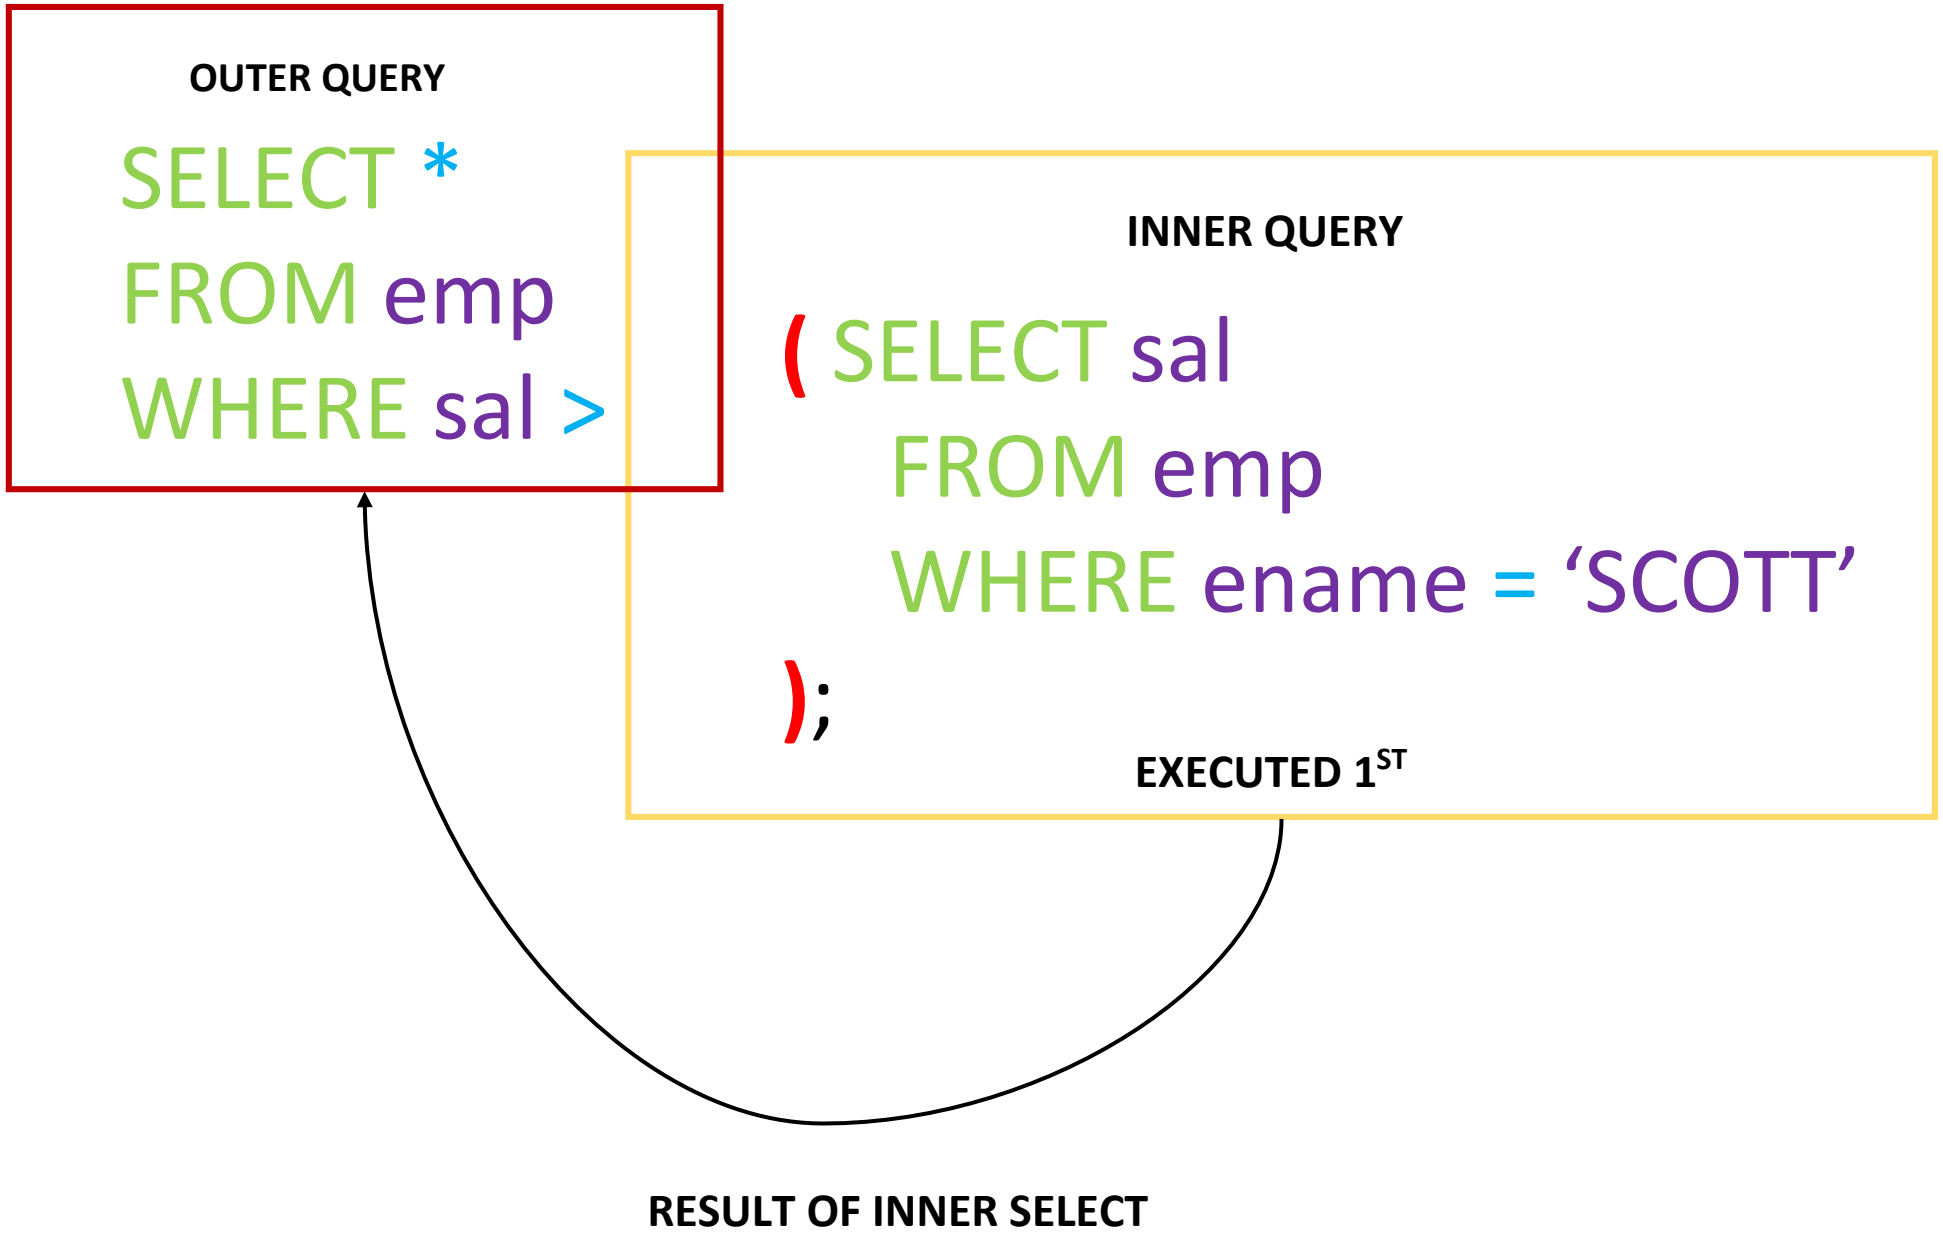
	EMPNO	ENAME	JOB	MGR	HIREDATE	SAL	COMM	DEPTNO
1	7839	KING	PRESIDENT	(null)	17-NOV-81	5000	(null)	10

SINGLE QUERY SOLUTION

```
SELECT *
FROM emp
WHERE sal > ( SELECT sal
              FROM emp
              WHERE ename = 'SCOTT'
            );
```

SUB QUERY or
INNER QUERY or
INNER SELECT





OUTER QUERY
SELECT *
FROM emp
WHERE sal >
INNER QUERY
(SELECT sal
FROM emp
WHERE ename = 'SCOTT'
);
EXECUTED 1ST
RESULT OF INNER SELECT

3000 (INNER QUERY RESULT)

```
SELECT *
FROM emp
WHERE sal > ( SELECT sal
              FROM emp
              WHERE ename = 'SCOTT'
            );
```

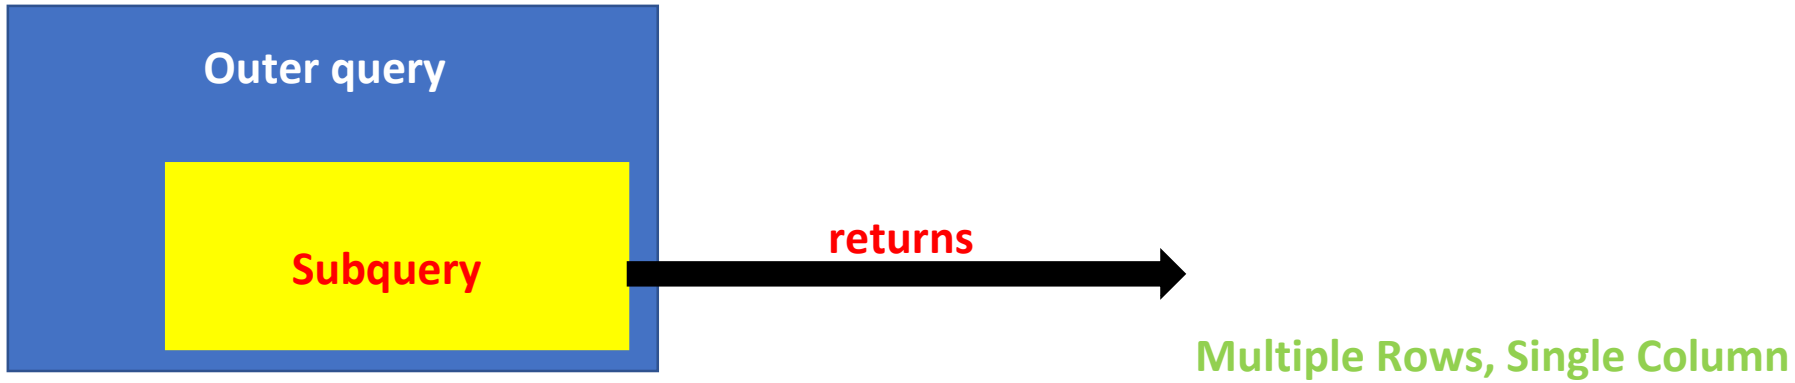
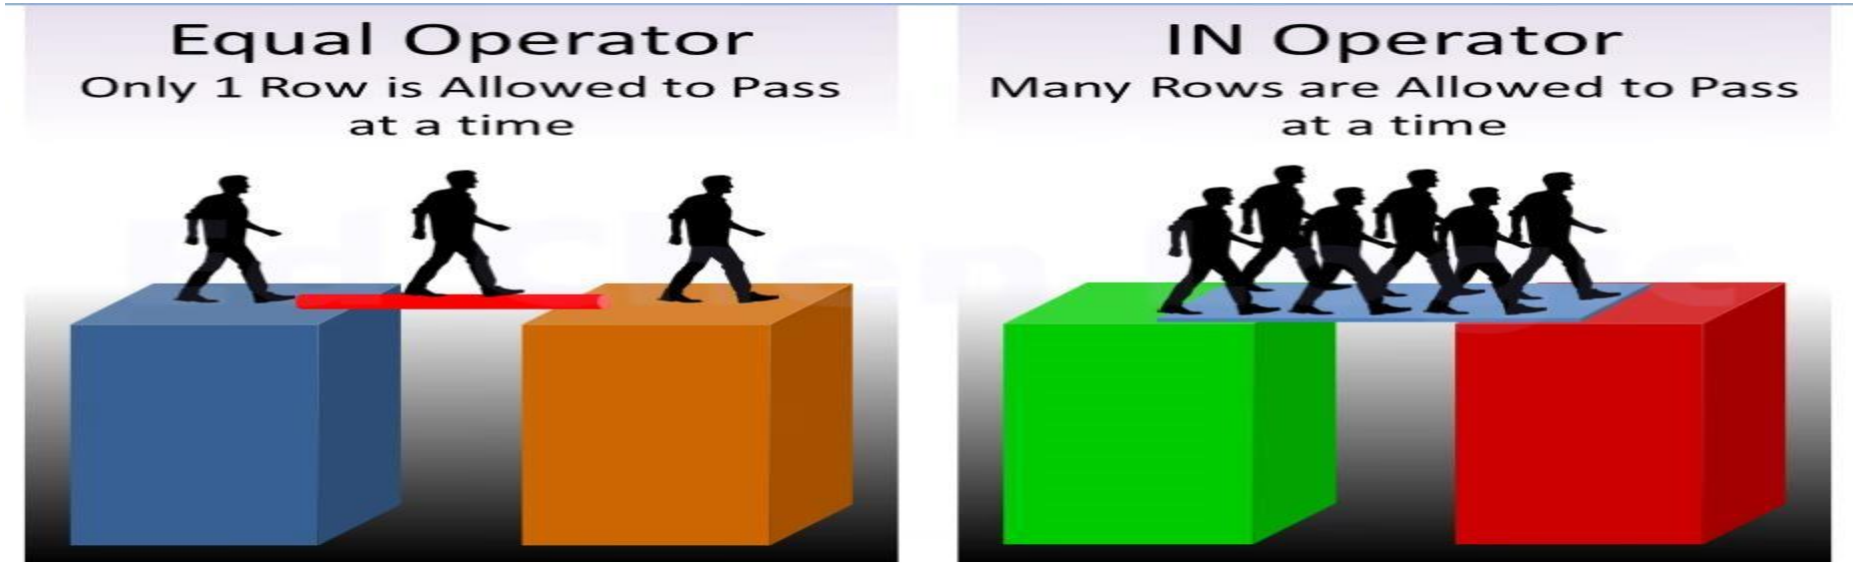
MULTIPLE ROWS SUBQUERY

- A **multiple row subquery** returns multiple rows to the outer query.
- Multiple row subquery returns a single column to the outer query.
- It can be placed in a WHERE clause, a HAVING clause, or a FROM clause of a SELECT statement.
- Multiple row comparison operators such as IN , ANY , ALL can be used with a multiple row subquery.



1. IN operator

- IN is a set operator used to test membership.
- IN indicates that the records processed by the outer query must match one of the values returned by the subquery.
- It is used to test a given value equal to any value returned by the subquery.
- The condition 'S1' IN ('S2', 'S3', 'S1') is true, whereas the condition ‘C1' IN (‘C2', ‘C3') is false.



2. ANY operator

- You can use the ANY operator to compare a value with any value in a list.
- You must place an = or > or < operator before ANY operator in your query.
- The <ANY operator is used to find records that have a value less than the highest value returned by the subquery.
- The >ANY operator is used to return records that have a value greater than the lowest value returned by the subquery. Or
- >ANY means greater than at least one value.
- The =ANY operator works the same way as the IN operator does

>ANY means greater than at least one value,
that is, greater than the minimum.

WHERE 70 > ANY (
); So >ANY (20,56,5,15,69,10) means greater than 5.

So 70 >5 is true, and data returns.

<ANY means less than at least one value,
that is, less than the maximum.

WHERE 70 < ANY (
); So <ANY (20,56,5,15,69,10) means less than 69.

So 70 < 69 is false, and no data returns.

>ANY means greater than at least one value,
that is, greater than the minimum.

WHERE 4 > ANY (
); So >ANY (20,56,5,15,69,10) means greater than 5.

So 4 >5 is false, and no data returns.

<ANY means less than at least one value,
that is, less than the maximum.

WHERE 4 < ANY (
); So <ANY (20,56,5,15,69,10) means less than 69.

So 4 < 69 is true, and data returns.

3. ALL operator

- ALL operator is used in conjunction with the > or < operators.
- If the ALL operator is combined with the “greater than” symbol (>), then the outer query is searching for all records with a value higher than the highest valued returned by the subquery (i.e., more than ALL the values returned).

Or •

>ALL means greater than every value.

- If the ALL operator is combined with the “less than” symbol (<), then the outer query is searching for all records with a value lower than the lowest values returned by the subquery (i.e., less than ALL the values returned).

>ALL means greater than the biggest value,
that is, greater than the maximum.

WHERE 70 > ALL (
); So >ALL (20,56,5,15,69,10) means greater than 69.

So 70 > 69 is true, and data returns.

<ALL means less than the smallest value,
that is, less than the minimum

WHERE 70 < ALL (
); So <ALL (20,56,5,15,69,10) means less than 5.

So 70 < 5 is false, and no data returns.

>ALL means greater than the biggest value,
that is, greater than the maximum.

WHERE 4 > ALL (
); So >ALL (20,56,5,15,69,10) means greater than 69.

So 4 >69 is false, and no data returns.

<ALL means less than the smallest value,
that is, less than the minimum.

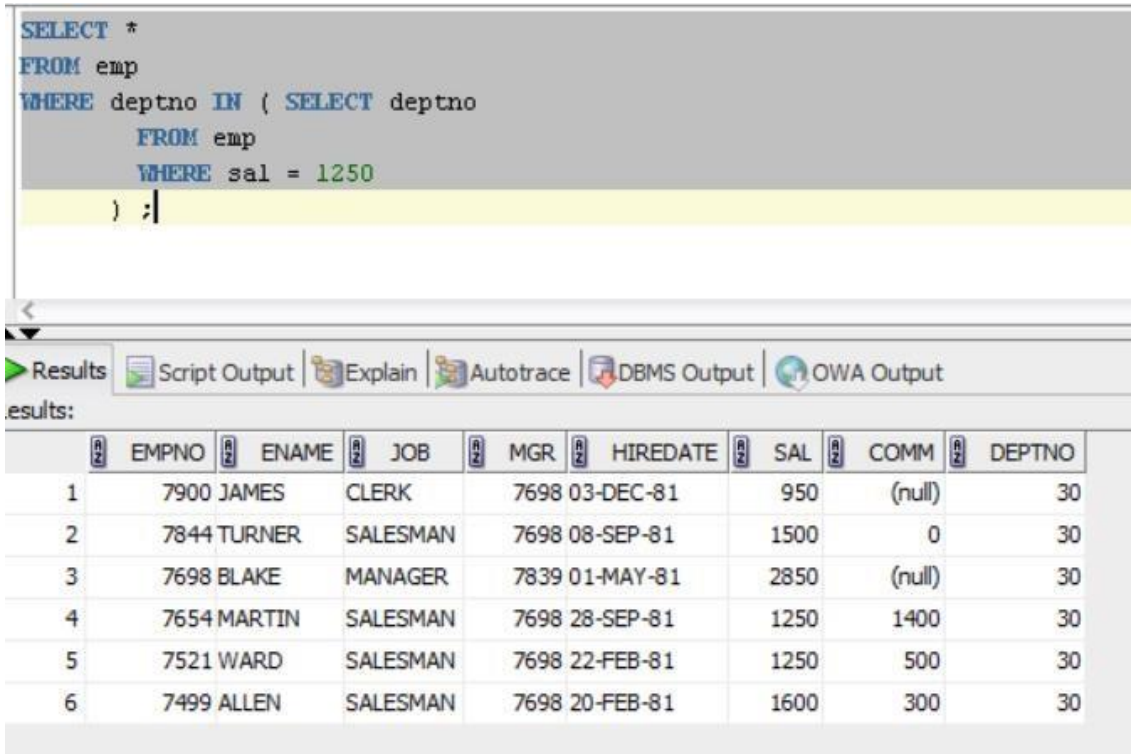
WHERE 4 < ALL (
); So <ALL (20,56,5,15,69,10) means less than 5.

So 4 < 5 is true, and data returns.

MULTIPLE ROW SUBQUERY

Display all employees who are working in the same department as that of employees who earn salary of 1250.

```
SELECT *
FROM emp
WHERE deptno IN ( SELECT deptno
                  FROM emp
                  WHERE sal = 1250
                ) ;
```



```
SELECT *
FROM emp
WHERE deptno IN ( SELECT deptno
                  FROM emp
                  WHERE sal = 1250
                ) ;

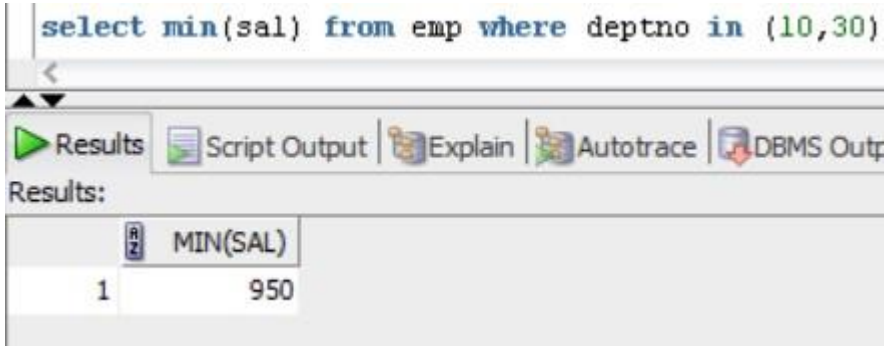
TASK B

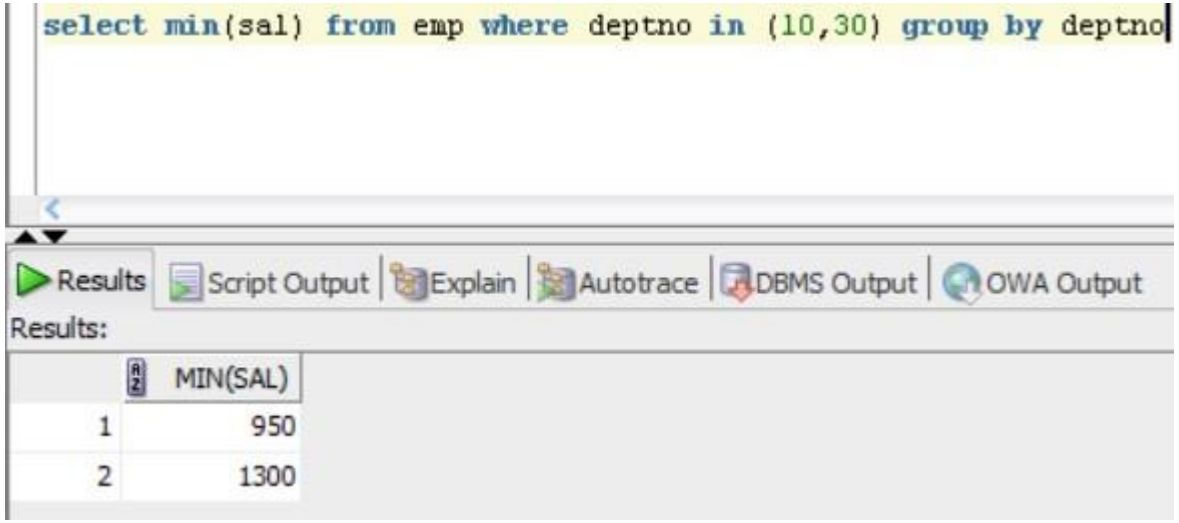
Display the employ numbers and names of all employees who work in a department with any employee whose name contains an ‘A’.

```
SELECT empno , ename
FROM emp
WHERE deptno IN ( SELECT deptno
                  FROM emp
                  WHERE ename LIKE ‘%A%’
                ) ;
```

TASK C

1. select min(sal) from emp where deptno in (10,30)
2. select min(sal) from emp where deptno in (10,30) group by deptno





MULTIPLE COLUMN SUBQUERY

- Multiple column subqueries can retrieve multiple columns for the outer query.
- The number of columns in the outer query and the inner query must be same.
- Column comparison can be Pair-wise or Nonpair-wise.
- A pairwise comparison is when you want to compare a pair of values from the row that is being evaluated in the main query, to a list of pairs of values provided by the subquery. OR We can say that it looks for a match of the exact combination of the columns in the same row.
- In the pairwise comparison, the database looks for rows in which the two columns match in the same row, but in the non-pairwise comparison, the database evaluates the conditions about the columns independently.

PAIRWISE COMPARISION

Display the details of the employees who are managed by the same manager and work in the same department as the employees with employee id 7521 or 7788.

```
SELECT empno, mgr, deptno
FROM emp
WHERE (mgr, deptno) IN ( SELECT mgr, deptno
                         FROM emp
                         WHERE empno IN (7521,7788)
                       )                                  AND
```

empno NOT IN (7521,7788);

INNER QUERY

```
SELECT mgr, deptno
FROM emp
WHERE empno IN (7521,7788)
```

```
SELECT ename,empno,mgr,deptno FROM emp WHERE empno IN(7521,7788);
